LED ILLUMINATION

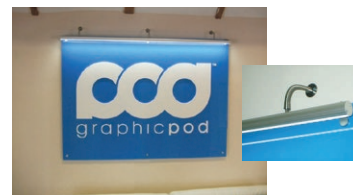

REDUCE YOUR ENERGY COSTS AND IMPROVE YOUR CARBON FOOTPRINT WITH LEDS!

Light Emitting Diodes can be used for new signs and feature lighting reducing energy costs by at least 65% over neon and 85% over fluorescent illumination. Existing signs and lighting can be converted, refreshing the lighting output and reducing your carbon footprint.

LEDs have been developed over many years for general lighting, but now this technology is becoming widely used for signs and lighting specifiers. Traditionally illuminated letters or feature lighting were restricted to the use of neon, or cold cathode tubing. This is a drain on maintenance resources, requiring high voltage transformers and safety devices. This also meant that the lettering was bulky and unless calibrated correctly, prone to failures.

Now with LEDs available they provide a safer alternative whilst also helping produce **Less Environmental Damage**. They operate on a low voltage, usually at 12v. The letter can be a lot thinner without losing any of the overall effect. All this and the maintenance requirement is dramatically reduced.

It's a win, win situation all around!
